

Block evaluation 2024-2025 Year 2 block A

Numeric results

Response rate: 83% (n = 75)

Organisation	Scale	Mean	Mode
The overall mark I would give for this block is:	1-10	6.31	7
I feel like I have received the tools, support and input needed to reach my learning goals for this block.	1-5	3.24	4
I feel like the block project and/or client fits the project goals and ILOs well.	1-5	3.67	4
I understood the assessment criteria for this block well. It was clear what was expected from me.	1-5	3.25	4
I feel like this block prepares me well for my intended career.	1-5	3.19	3

Content	Scale	Mean	Mode
Obtained a good understanding of research methodologies.	1-5	3.68	4
Obtained a good understanding of research ethics and data management.	1-5	3.56	3, 4
Obtained a good understanding of statistics.	1-5	3.32	4
Obtained a good understanding of academic writing.	1-5	3.49	4
I rate the statistics module a:	1-10	5.64	7

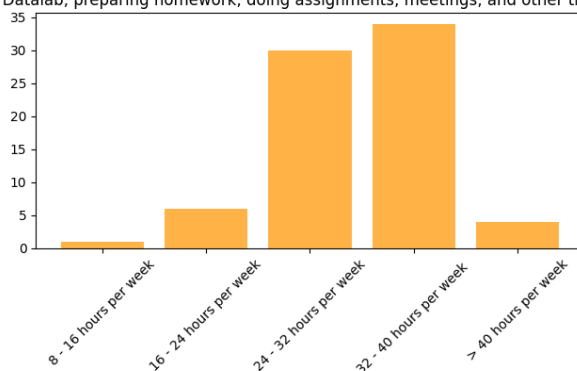

Staff	Scale	Mean	Mode
What is your overall rating of your mentor?	1-10	8.97	10
What is your overall rating of the block supervisor?	1-10	8.15	8
I feel like my mentor provides clear and constructive feedback.	1-5	4.49	5
I feel like my mentor is easily approachable and I can ask questions when I have them.	1-5	4.44	5

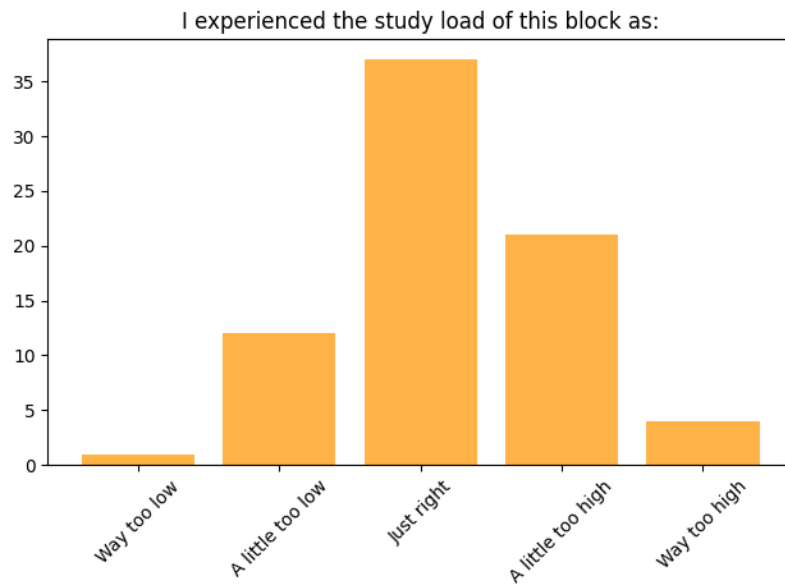

Previous block	Scale	Mean	Mode
The assessment criteria of Block D were clear upfront.	1-5	3.59	4

Plots

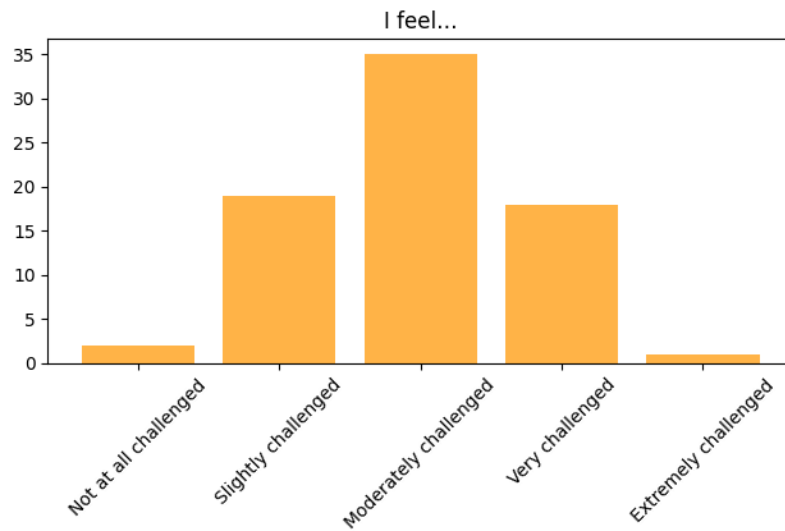

How much time did you spend per week on the block on average?

This includes attending Datalab, preparing homework, doing assignments, meetings, and other things related to the program.

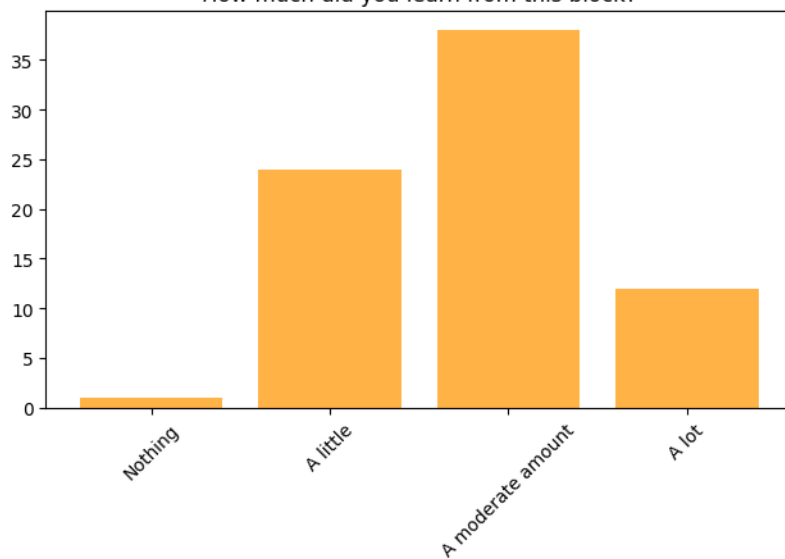

How would you rate the level of intellectual challenge of the block?

How much did you learn from this block?

Positive experiences from the students:

1. Engagement with Research and Data Analysis

Learning new skills, applying statistics to real data, gathering own data, learning more about qualitative and quantitative research, doing interviews

2. Workshops, Lectures, and Supportive Learning Environment

Students enjoyed the workshops (scrum and academic writing), clear explanations, structured deliverables and a positive working experience with peers and mentors.

3. Flexibility and Autonomy

Students mention that they liked that they could shape their own research, that they were flexible in their planning.

Points of improvement from the students:

1. Clarity and Guidance

Confusion around templates, requirements, or guidelines for deliverables like the policy paper, presentations, or poster projects. Some mentioned that the block's structure felt disorganized, with some elements starting late or being out of order (e.g., Scrum workshop happening too late, project starting in week 3).

2. Statistics Module and Exam

Students mentioned dissatisfaction with the statistics module, asking for more lectures, formula sheets, or additional learning resources. On top of that, they experienced the workload as being overwhelming with too much content in a short period. Some students say the exam was too challenging or poorly aligned with the provided materials.

3. Workload Distribution and Timing

Students suggest that SCRUM needs to be in week 1, they ask for more intermediate deadlines (?) and that the workload was not balanced throughout the block; overlap with statistics and the main project, statistics too much early on.

Conclusions staff meeting

Survey results

- Statistics: marks were low, but students didn't work hard enough.
- Preparation for career scores low: understandable for a target group that likes engineering, but it is important. Sometimes you have to teach less liked topics and accept that the rating for the block is lower than you would want.

Policy:

- Having a second point of contact of statistics would be good; next year students will be better;
- Formula sheet will be provided;
- The main question is how do we make students work harder;
- Move chapter 1 and 2 to 1A (Alican and Avril will discuss);
- Organize workshops, let them teach;
- Engagement improvement by splitting qualitative and quantitative research.
- Consider changing the focus of the block to statistical analysis
- R or Python
- Communication remains key.

Changes 25-26

To be added by block responsible next year

Open answers

The thing I liked most about this block is:

Think about topics, modules, projects, workshops etc.

Open AI day was very fun and informative

I like the group work dynamic

The open AI event was fun to attend.

For this block, it felt less overwhelming compared to the previous ones.

N/A

I liked researching for our project, and finding out what people think about our topic

Learning more about statistics

Statistics and individual research paper

.

coding the analysis

I like the poster part. Talking with other people what they came up with.

Doing qualitative and quantitative research

I liked the workshops and the presentations, I also liked that all the deliverable requirements were clearly explained

N.A.

The research that we had to do. The interviews were a fun experience.

The research part was fun, doing the interview and creating the survey

It was good to learn how to do research. A skill usually for university level programs but it is handy to know.

The statistics content

workshops/lectures that help us complete our tasks but not in a direct way

Statistics and the details on how to make research papers

Learning something new about how to make a research paper

I felt like I actually applied an useful research for businesses and the AI field

there good amount of time to do each task

Uh all neutral

Not much

I liked the different assignments working towards the end goal of the policy paper because this gave more structure to the block and what was tasked for the week.

There was good time management, time assigned to tasks was enough to finish them.

I liked the freedom we were given with the research topic. I liked the fact that we learned how to collect and prepare data for research, which I think it is a great tool to have as a data scientist and as a student for the future.

Quantitative analysis.

My Team and the topic of cybersecurity. It was fun to do research.

I really liked the topics of discussion for the projects deliverables and the scrum workshop.

Working in groups was fun

group project

Clear information

I liked learning how to do a literature review (on my own) and to create the poster.

stats a little bit but not the way the test was formulated

Research nuanced subjects, doing professional work, and having access to actual data (like forms), I liked that I could choose my subject

Data Analysis and Methodology was quite interesting!

Pretty much only statistics, it was the only thing that felt useful.

I liked to scrum workshop

I like this block in general, I've done it 3 times now (so much for staying anonymous xD) and really enjoy the data analysis part of the whole thing, I really love finding meaning in data. I really liked the statistics material, even though the actual exam went horrible. And the scrum workshop was a lot of fun with the Legos.

The writing, it was different to programming for once.

The interviews

I think the load and amount of work was good

I liked that the research aspect of this block, it was refreshing after a year of only coding

All of the topics were interesting to try and hear about

Learning how to interpret papers

Conducting a real data research

I liked the structure and the workshops, I also liked the project topics. It was a little bit messy since we had to figure out our own schedule for ourselves and stay on track without any pressure or deadlines.

Workload was fine if we all have enough math background, otherwise it's still too harsh for some students.

Shival ;)

The thing I like most about this Block was the freedom to decide what you want to work on every day

I liked that we had the freedom to broaden the research as much as we want to.

Concluding data driven decision making based on the hypothesis.

Researching something I like.

When I could start programming in python. I was doing statistical analysis.

The data analysis part

Projects and the difficulty.

The part that I liked the most about this block was the fact that there was autumn break.

The project with SMEs was really interesting.

Data analysis, Methodology, Poster Creation

The new structure of ILOs

My research topic specifically.

I liked the workshops but i prefer to have them in the 1st week rather than week 4

Analyzing Quantitative Data

Workshops

workshops

Group work

Jason, good mentor

I enjoyed the topic but not the whole academic writing.

Statistical analysis and the professional way to conduct an observational study

Topics are good, it was nice to choose our fav topic.

The autumn break

I liked the workshops and how we got more lectures this block.

I had a great team and it made the block feel better for me

One of the things that I really liked about this block was being a member of a good group. Because we all worked well. Also, I learned so many things regarding the chatbot topic.

What could be improved in this block is:

Structure because it wasn't clear all the time what we had to do

The templates were not clear all the time

The presentation is very unclear what we had to do
It felt like we started in week 3 rather than in week 1

A lot of things were unclear such as templates like the policy paper

The structure of the course felt very weird with things happening out of an optimal order

Effectively starting in week 3 with the project was a bad start, issues with this I have already addressed to Mohsen last year, it would be more useful if we could pick a topic during the summer holidays or week 9/10 challenges so we can start in week 1.

The requirements for the presentation and the poster are exceptionally unclear, especially since we are partially scored on how we present some more guidance would be helpful.

The Scrum lecture happened too late.

For example more time for the final exams such as the statistics exam we had.

N/A

statistics

Writing a research paper using survey data was not that motivating

The survey data provided was highly skewed despite mentioning the possibility of this happening before the survey was distributed.

Github pages were not aligned with assessment rubric

Statistics exam (it should be a bit different)

Most provided lectures did not feel useful.

.

Statistics how is taught actual lecture on it only 2 people got above 90%

End of the block drinks

The woman entrepreneur event was not suitable for us students to do our presentations

Statistics...

The workload for the statistics exam was too much. We had to learn 7 chapters in 3 weeks. This ILO was 20% of our grade which I think is a lot for something that was done for the first time.

The woman conference that was organised by Digiwerkplaats was not suitable to the students that went there.

There aren't any drinks at the end of the block

Reevaluate the female entrepreneurship thing and maybe don't send males or find another presenting opportunity.

Distribution of workload (especially for statistics)

The beginning of the block, in my opinion, the SCRUM could've been introduced earlier

In person classes for the statistics

Communication, exam, clearer requirements to the freedom of the papers

Clear criteria and requirements

the statistics could be more supervised

More clear

Less writing, more code,

The information about certain details such as that both quantitative and qualitative need to be done since that was relayed a bit later in the block.

In some cases (for example policy paper), the material does not mention some stuff that we need to have but mentors expect us to have it. I hope for next blocks the material states in detail exactly what we need to have on each document/deliverable.

I think there was a lot of free time, compared to other block. Not necessarily bad, I love free time, however sometimes there were days in the datalab where I did not anything and there was also not anything to do.

more explained content (for research paper, policy paper)

A bit more guidance. Of course not too much, but we were very much left to our own devices.

More clear templates, that we can follow in case it is asked of us to do so, and the templates shouldn't come after they should have been completed.

the execution of the statistics exam was not very good

more programming

Statistics exam

Requirements for deliverables, more indications?

test for statistics on paper and more useful ways to learn stuff.

The subject would be more divers

A lot of things, workload was distributed awfully, the first week when we had no topics yet we only had to work on one chapter of Statistics and from second week on when we actually had to spend a lot of time on the Research Proposal and Data Analysis we expected to do 3 chapters. I also really against the Statistic teaching method we used, I feel like like the exam results are speaking for themselves, offering formula sheet, lectures or just more guided study methods would have been a huge help, but even on request these things didn't happen! Nevertheless, way more guideline for things like Policy Paper, Data Analysis and collection, information just wasn't proper, cuz we had different information on Brightspace, Creative Brief, and from the mentors which was really confusing and hard to follow.

- Scrap doing research, this stuff is so boring! I feel it doesn't contribute anything to me professionally nor personally.

- Overleaf is a pain in the ass, and not something I wish to use ever again. Word is sufficient.

- Pretty much only in the first week were we given material to learn. This material was probably more than 40hrs. I don't think you should honestly expect us to finish all of that.

- Honestly, I just despise this block. I don't want to do research now, but also never in my career.

- Make sure to fill each template in yourselves. It's a bit silly if students ask questions about the templates (for example DMP templates), and mentors don't know what to fill in.

Have clearer tasks and explain what we need to add to our papers in more detail

I think having a formula sheet for the exam would be a lot of help, no names of the formulas, no explanation on the variable or anything, just the formulas themselves. There were so many that I had enormous trouble remembering the specifics of each formula.

More clarity and the quantitative and qualitative analysis (we all of a sudden had to do quantitative analysis if you were going qualitative analysis)

felt like the work load was a little high

I think guidelines for evidencing would be highly appreciated (what links are expected etc.).

I think a bit more freedom with choosing the topic would have been better

spend less time on statistics or make it worth more points so it actually feels like it is worth it to spend all my time on it.

Probably the design of the blok, first we have to do team work then independent and then team work again. Seems ineffective

The math module

more deadlines between week 3-7 as we were given too much freedom (I didn't really know what to work on specifically)

Maybe giving us some more time for the statistics module.

More video/audio learning materials on statistics

The extra help with statistics

I think the way to teach statistics could have been way better, we were all disappointed in the review session.

The statistics course maybe should be longer until the end of the block, not to have just one month to prepare.

The statistics exam was disappointing for everyone!

Prolific gave very skewed data. Also, the DMP should be put later into the project, when we actually have the data and all of the information.

Try to give a better overview about the project at the beginning of the block. Change this type of poster presentation, because I cant see the purpose of it, and it doesnt really make sense.

The presentation part and the part of collecting the data

The time and communication

In this block I believe that the statistics part could be managed differently. For this block it was really messy as at the start we had to do a lot of work on the research and on parallel we also had to study for the statistics exam, which was also an insane amount of content for 4 weeks. Also, the fact that the statistics was such a small part of the grade and so much to do, it was quite discouraging to purposefully go through everything with attention.

More clarity of how the survey distribution works helps students pick an easier topic to research.

Include lectures & formula sheets regarding the Statistics Module, Clearer guidance in the policy paper and better preparation when creating the GitHub tasks, for example: some instances of incorrect tasks such as the Poster creation guidelines.

Detail the expected structure of requirements:

Policy paper

Poster

Scrum master evidence

I still don't know what user stories is

The course orgnization and instructions are vague and need some work. It looks like an outline of an idea rather than a proper assignment/project

Statistics

More explanations about the final deliverable could be included

Lectures

give more time to stats

More coding

Organisation en the statistics test was to much to learn

More explanations about the required documents, better APA style templates

I believe the preparation for the statistics exam lacked structure and proper courses on it. I do not think it is feasible to give a large book and just 3 tutorials to discuss the problems, we were not thought by proper by a lecturer that would guide us through the theory and exercises.

Add tow more topic to create diversity

Not have main ILOs overlap, like the stats and the main project, it was too much. Explanation for the strucure of the policy paper.

Balance the statistics a bit more throughout the block

More communication between mentors regarding requirements for important tasks. Maybe clearer criteria for ILOs would be nice.

Improving the instructions and providing some tips about studying statistics.

Option to elaborate on the study load, intellectual challenge or support offered:

The workload was high because some of my group members slacked off the first few weeks, if not for that the workload would be fine because the workload was divided equally in week 5-8

Some team mates weren't very active during the start of this block.

The biggest challenge was finding people to interview rather than a mental challenge.

The study load was not the highest I would say compared to the previous blocks.

N/A

i hate statistics, too much statistics

There was no real intellectual challenge other than studying for the stats exam. The research paper came down to writing enough words without much content to reach the word limit

..

.

I said it above but I think there should be more lecture on statistics

Overleaf premium would have been really helpful, since only 2 students could edit a project

One member from my team wasn't contributing to the project so I did more work than I planned on N.A.

Overleaf premium would be very handy, if you are working on a group project. Also Canva premium for the block poster.

The study load and intellectual challenge where just right

It felt like it was a little weirdly distributed but with good group planning it was fine

There was a lot of work, but it wasn't necessarily challenging

na

No comment

Support was there, block was just weird overall

The paper was my biggest challenge due to personal reading and writing problems (dyslexia). Study load was very good, but I personally ended up having a lot of free time in my last week (which could be due to me working through the holiday)

the study load was really good, my only note was about the statistics it could have been more supervised

Datacamp's ect

I do not think this block was that meaningful towards achieving necessary skills to pursue a Data Science-related internship

Support by the mentors was really well and active during the whole block.

.

As I said before, there were datalab days where there was nothing to do, other than revisit already done material.

Writing so many professional papers can be challenging, but I got the right support from my mentor and my team.

I had a moving so the low workload was good. though i constantly felt like i was missing something because it felt like we did not get much guidance throughout the project.

The templates on the quantitative study were given to us too late into the block.

it was fine

I think we should have another things for us to training programming related to AI.

.

I felt like, again, the content was messy. example: we had to think about research questions and after that identify a gap, which was confusing and useless.

no comment

At least it wasn't too busy which is even worse for my studying experience. However I felt like the weeks in the middle of the blok were a bit empty. I used the leftover time for self development so it's not that bad.

Study load was much and poorly distributed among weeks, especially Statistics.

Intellectually was alright, just the study load and distribution was awful.

I got most of the tools and support, but cuz the unspecified information everything got confusing after a while and took more time to figure it out which put us behind schedule.

support offered: we only received tutorials and material in the first week, the duration of which was way to ***** long. The lectures for example by Bert felt like a waste of time, and pretty much took the concentration out for the day.

I feel like more material with explanation could have been given.

The block itself is not too hard, however I would've preferred the exam to have been at the end, because it really felt like 2 weeks preparation, 4 week statistics, 2 weeks data analysis and report writing, and it felt disproportionate. On the support, I've put a lot of steps in myself as well to ensure I get more support, for example, me and my mentor meet once a week instead of once every two weeks, I'm having frequent meeting with the school counsellor, its great!

-

.

I think the study load was balanced. There could have been more time or better tools to analyse the data, maybe that would have improved the intellectual challenge.

Too much statistics, everything else was fine

Statistics was a bit low effort

Na

I didn't do anything from week 3 - 7, aside from the statistics exam and some data analysis, yet I still easily managed to complete the tasks for the block

The study load was okay, we got a lot of support from our mentor Alican.

More specific instructions would always be nice.

A lot of unclarity towards the papers we had to deliver

I would not put strongly agree, because there could have been an improvement in statistics

We had the option to elaborate on the topics we chose, but the challenge was not that much

Too little studying material, only links to outside sources.

There were things to think about like the topic, approach (for the papers), but there was nothing very challenging.

-

The block was pretty easy even if it addressed something different

No comment.

As stated before, the statistics exam and research paper were quite a lot, having to do both at the same time. Also, to add on that, the themes discussed in both of these sections required a lot of intellectual knowledge and methodology that should not have been thought in that brief of a time span.

The support offered was great however it was overshadowed by things like not getting a formula sheet in a statistics exam, After the second fire alarm went off something other than continuing the exam through the alarm should have been done, ESPECIALLY not keeping the students inside during a fire alarm.

As mentioned before, proper lectures for statistics would be good and appropriate and a provided formula sheet would be best in my opinion as several of my peers have also received low marks due the lack of a formula sheet.

I found this block to be more of a exercise on academic writing than learning something special.

Overleaf was a new concept tho.

Nah

Statistics was too much

-

-

.

-

It was to much, the stats test and a 4000 report to on top of each other

Classes were better for the statistics exam

Proper lectures and tutorials.

Writing the research paper was good and relevant, however the 4000 word felt like to much and I had to add volume and add irrelevant information that is not benefiting the task.

like I said, the overlapping of the stats and the main project was far too much.

it was just right for the amount of things needed to complete

I got a lot of support from mentors.

I enjoyed researching and learning about our topic and learned a lot. However, for some of the exercises, I needed better instructions to be able to provide high-quality work.

Additional comments on the block in general:

The research paper is really good thing to have but I just don't like writing in general that was my main problem

I don't feel like the extra tuition is being used, or at least it does not feels like we are getting more this year, I would even say we are getting less

Overleaf premium would have been nice

I feel like because we didn't have specific interested SMEs it was hard to grasp what exactly we could research to provide good recommendations

The block was not my thing, communication about the block was sometimes not that clear. Team communication was worse than last block because of this. This made the block extremely ruthless

The available criteria was way more clear than last blocks, but I did notice most tasks had missing criteria

Decent

The block was fun

I really don't like writing and I don't feel that is a necessitate for the future. I might be wrong though.

Annoying

I really, quite strongly, dislike this block. In fact, I despise it. I hope never in my life to do research again. This block contributes so little to my professional development, and I struggled motivating myself to get through it. The only thing I take away from this block is statistics, but the rest I'll probably forget.

it was a nice block

no

Personally I need more skills in reading and utilizing the findings in research paper rather than writing them, besides it's hard for students in our stage, with limited means to get data, to write something really useful and evolutionary in the academic field.

Just statistics was hard tbh

There could have been a big improvement in the statistics part. I felt like it wasn't learning at all, it was just memorizing and that is not the point.

Some of the criteria are really hard to evidence for example the qualitative parts for students that made quantitative or the other way around.

Maybe come up with a team member adjustment procedure or something to ensure that idiots are mixed with adequate people. This block felt miserable for me as I had to babysit 3 people unwilling to do anything

no

Option to elaborate on the research methodologies materials:

Github pages were messy and unclear. Not sure which pages relate to this part of the ILO

We had a couple optional courses in the beginning of the block, but for example the poster at the end, we could have received more information.

The lectures were a little off topic

We often had no examples or explanations about how to perform the methods until Tsegaye heard that feedback from us and provided it to us

It was solid

The lectures provided enough information to understand the methods.

I think we had the right tools and material, but the time for research wasn't enough!

It was fine, but in the first week there was way too much material across writing, research, and whatever else. I think there was more than 40hrs of courses, which you honestly can't expect students to do.

I would have enjoyed another lecture on qualitative especially because I did quantitative and feel like I don't know how it works

Lectures were very good, qualitative and quantitative guidelines were clear although some confusion on the ILO requirement including the surveys and interviews.

They made me feel like a professional in the field of research.

I feel like qualitative analysis wasn't explained well.

Option to elaborate on the research ethics and data management materials:

Github pages were messy and unclear. Not sure which pages relate to this part of the ILO

The lectures could be improved.

The lectures again were not on topic

The templates and lectures were helpful, but the criteria were unclear

Good

Lecture and ability to ask for feedback from the lecturer made understanding the materials easier.

I think, we couldn't focus on this part as much as I wanted due to the study load!

I honestly don't remember. The templates felt weird, as we had to do them with very little information. Even mentors didn't know how to answer the questions about them. Does no one proofread these things from a student's perspective?

It was not very clear the point where we needed to work on the DMP, more explanations are needed in details.

Personally I understood it as I have previous experience with data management but I heard a lot of confusion about it.

Lecture was good and a proper outline on what needs to be done was given.

A lot of paperwork, I found almost all relevant

We just received materials and from that we were supposed to read them, I'm not satisfied with that but I after all I understood these topics. The lecture seemed like it diverted from the topic a lot.

Option to elaborate on the statistics materials:

I feel like the book did not provide the necessary tools and explanations. Googling a specific term made me understand things better than the book. A lack of mathematics explanation meant that a lot of things were not understandable when doing the exam or preparation. The book often mentions "using an online z-table" as though I am supposed to magically understand that z-table, equations are left out often enough that I have 0 clue how to calculate certain statistics.

i hate statistics, why do formulas change with every single situation

It was clear what was being asked of the students, making it possible to create a clear roadmap to the exam

More lectures on it

The materials spoke for itself. And with enough practice, which was available through the quizzes, book and notebooks, a sufficient mark was easily achievable. I also liked that the teacher did not give the answers, but went into discussion with the students. For me that is better than just giving a list of all the answers from the quizzes

I feel like it was too rushed and I was stressing too much even without the statistics, I would've preferred if it wasn't only delivered by the book and individual learning

Statistics was too difficult. Too much workload.

The book provided the material well, and explained it well. However, a lecture on the statistics with actual exercises could be incorporated.

We could have been given a lecture about how to use the formulas and in which cases, instead of just figuring it out on our own and having review sessions

The book was a nice thing to learn of, but I don't feel like we got enough feedback and the exam was focused on only a few specific topics of many

it wasn't supervised, it's true that there were quizzes but we needed more interaction with the mentor

The book was a bit vague

The book, and notebooks were good tools to study but the exam was hard.

More group practice on the exercise and maybe a formula paper

Giving a book with 250 pages, with theory and problems, for 3 weeks and then expecting to have 3 "Review-Meetings" and fix everything is delusional. I understand this course is "self-study" based, but anyone AT HOME could get a book and learn the materials.

I was a bit hard for me to understand

In my opinion, the whole statistics module was poorly organized, and the chosen study method was also not appropriate for the university.

Pretty much the only useful part of this block.

It was a lot of time and effort, and I still feel like I have not done enough to understand it.

we could've had a formula sheet but I like statistics either way

We were just given material, but didn't get taught

Too little help

It was hard and a cheat sheet would have saved me

Its okay the mentor expects a lot from us, but it never hurts to go through a few exercises from every chapter to make sure your students understand what you are teaching.

Provide some more online tasks to practice.

I would have liked more to have actual classes and not online meeting or review session where the teacher would go over the material and as well the exam structure I think it need to be changed, maybe split it into two and provide a small formula sheet

The whole subject was just squeezed into a too little time frame and you had to learn about these insanely complex ideas, while also doing research on the side.

The questions I asked often got a slightly hostile response and made me feel dumb for asking.

The lack of a formula sheet made it difficult for me to memorize the formulas. Integrating Lectures into this block with a live exercise-solving session would also be a nice help if it were to be considered like in Y1B, where we had a list of exercises to solve in the notebook.

Soo much material in so little time. If you have never dealt with statistics it's quite hard. Maybe show them the material for the summer before block A year 2

Nice quizzes on Brightspace!

I liked it

I elaborated before, it need a University of Research type of teaching, or at least one that is more supervised.

Maybe different learning method like Khan Academy would be good to enhance practicing wasn't necessarily hard but just allot

Option to elaborate on the academic writing materials:

The workshop provided was good, but again the Github pages were messy and unclear. Not sure which pages relate to this part of the ILO

Overleaf premium would have been very helpful for the group projects

The academic writing materials were good, however, we could get Overleaf premium.

We didn't have OverLeaf premium

The tools were easy to use, but the workshop didn't feel like it provided enough information

Once again, criteria was very unclear, for the policy paper especially

This was good

Academic writing was clear and findable in the datalab page.

I think some aspects like how to do the research paper could be explained more.

Academic writing was alright!

Did we get any guidance on academic writing?

I mean I used most of my own experience with writing papers, there weren't any extra tools really reached out.

There could have been an online lecture on how to use Latex.

I barely reviewed the academic writing materials as we had learned about this last year.

Research paper and LaTeX were good and the right tools were given but the Policy Paper materials were confusing.

-

-

I find latex great and easy to understand and use.

Overleaf was frustrating for many, but I understood it on a basic level.

Room for any final remarks:

-

-

End of block drinks please!

hope I make it this year :]

I feel like this block does not prepare me for a career in data science, it seems like the individual research paper and poster do not add any real business value either. Felt more like ticking the boxes and getting over with this block

I feel like this block would've worked way better as an individual project rather than a group project. Make technical blocks group based.

I hope never to be forced to do research again. If this block was focused just on stats, it would have been a better block.

It was a calm, I learned something, could have been a bit more perhaps but I do not consider this time wasted

Just a lot of unclarity in general

no

no

Overall good block, but the criteria and tasks could've been better

Statistics module requires some work 🧐

Any comments on the assessment of block D:

I felt confused from some criterias on the ILOs

I don't like the new format it looks super subjective of the person grading. It doesn't show how exactly the points are going to be given as well

I think the ILO's were more difficult to understand this block

-

I don't feel like we're getting back the extra amount we spent for the study as it is a lot of money. There are no licences from buas we get like adobe creative cloud, overleaf or even just the end of year drinks. It would be good to invest some in this or at least explain where the money goes in my opinion. Furthermore No remarks and it was a good block which I enjoyed! :)

The assesent rubric was clear

Improve clarity

I guess so because that's the only block so far I've made 1st try (this was 3 years ago xD)

I liked this block. we made something that was actually useful. It's a shame that there is no further follow-up with ANWB stakeholders

I don't remember

The assessment statement is confusing as usual.

Most were clear but a better explanation for what needs to be done for qualitative ILO's for quantitative students would have been nice

ILO 1, verrrryyy confusing and unnecessary (I believe) for the scope of what we are supposed to learn
Easy block

I'm proud of my team's grades and effort, but I disagree with the way of selecting the best presentation since those forms could be very biased between students

Far better compared to the newer assessment system of Year 2, simpler to follow and the objectives were clearer.
